a.
Upregulated
Metadata comparison
Most variable pathway clusters
DNA strand elongation involved in DNA replication
establishment of endothelial intestinal barrier
ISG15–protein conjugation
negative regulation of ferroptosis
negative regulation of viral genome replication
Notch receptor processing
nuclear protein quality control by the ubiquitin–proteasome system
phagosome–lysosome fusion
platelet formation
positive regulation of interferon–alpha production
positive regulation of leukocyte adhesion to vascular endothelial cell
positive regulation of TORC2 signaling
regulation of establishment of T cell polarity
regulation of interleukin–1–mediated signaling pathway
regulation of translation in response to endoplasmic reticulum stress
circulating–vs–other
primary–vs–cell-line
microarray–vs–RNAseq
Normalized AUROC

b.
Downregulated
Metadata comparison
Most variable pathway clusters
antigen processing and presentation of peptide antigen via MHC class II
cytoplasmic translation
microtubule depolymerization
positive regulation of DNA–directed DNA polymerase activity
proton motive force–driven ATP synthesis
proton motive force–driven mitochondrial ATP synthesis
regulation of mitotic cell cycle spindle assembly checkpoint
circulating–vs–other
primary–vs–cell-line
microarray–vs–RNAseq
